

Auto Ticket Classification using Flow Designer

Brainstorming & Idea Prioritization Summary

TEAM ID

SWTID-2026-8437

DATE

01 October 2026

PROJECT TYPE

ServiceNow
Automation

MAXIMUM MARKS

4 Marks

Step 1 Team Gathering & Problem Selection

Selected Problem Statement:

School IT helpdesk staff spend excessive time manually reviewing newly created incidents and assigning categories. The project aims to automate classification by analyzing keywords in the incident Short Description and Description fields using ServiceNow Flow Designer.

Step 2 Brainstorming, Idea Listing & Grouping

1. Automatic Classification

- Keyword-based classification via Short Description & Description.
- Use Flow Designer decision logic for auto category assignment.
- Create reusable keyword rules for common issue types.

2. Ticket Routing

- Route network incidents to network support teams.
- Route hardware tickets directly to hardware support.
- Assign password/account issues to access management.

3. Helpdesk Efficiency

- Reduce manual category selection by IT agents.
- Standardize incident classification patterns.
- Trigger classification instantly upon incident creation.

4. Future Enhancements

- Add priority assignment based on ticket keywords.
- Detect duplicate or highly similar incidents.
- Explore AI/ML models after no-code validation.

Step 3 Idea Prioritization Matrix

Idea	Importance	Feasibility	Priority Rationale
Keyword Classification	High	High	Directly addresses manual categorization; perfect no-code fit.
Automatic Ticket Routing	High	High	Improves downstream handling immediately after classification.
