Customer-Centered Problem Statements

Problem Statement 1 (PS-1)

Helpdesk Agent Perspective

I am (Customer)	An IT helpdesk agent handling incidents from students and teachers
I'm trying to	Quickly review and correctly categorize every incoming incident
But	I have to manually inspect each request and select a category
Because	Incidents arrive with different descriptions such as Wi-Fi, projector, password, and slow-computer issues
Which makes me feel	Frustrated and slowed down by repetitive manual work

Problem Statement 2 (PS-2)

IT Operations Perspective

I am (Customer)	A school IT support team responsible for efficient incident handling
I'm trying to	Route incidents efficiently so they can be handled by the appropriate support area
But	Classification may take time and can be inconsistent when performed manually
Because	There is no automatic keyword-based classification at incident creation
Which makes me feel	Concerned about delays and inefficient ticket handling

Consolidated Problem Statement

School IT helpdesk agents need a simple way to automatically classify newly created incidents because manually reviewing descriptions and selecting categories is repetitive and time-consuming. A keyword-based Flow Designer solution can reduce this manual effort and make incident classification more consistent.
