Problem – Solution Fit Canvas

AREA 1

Customer Segment(s)

Primary: School IT helpdesk agents / IT support staff who receive and process incident requests.

Secondary: Students and teachers submitting incidents (Wi-Fi, projector, password, slow PC).

AREA 2

Jobs-To-Be-Done / Problems

- Classify newly created incidents into appropriate categories.
- Review incident information quickly and consistently.
- Reduce repetitive manual classification effort.
- Improve ticket routing & handling efficiency.

AREA 3

Triggers

- Creation of a new incident request in ServiceNow.
- Incident contains keywords (e.g., Wi-Fi, projector, password, slow PC).
- Growing volume of daily requests demanding faster triage.

AREA 4

Customer Constraints

- IT staff have limited time during high incident volume.
- Manual review and category selection must be repeated for every ticket.
- Classification relies on user text in Short Description & Description.
- Requires a maintainable, no-code approach.

AREA 5

Available Solutions

- **Current:** Manual review and category assignment by IT agents.
- Manual process is time-consuming and inefficient at scale.
- No automated text classification currently exists in the baseline setup.

AREA 6

Behaviour

- IT agents read Short Description and Description.
- Identify issue type and select matching category.
- Proceed with manual ticket routing and handling.
- Repeat identical review steps for all incoming requests.

AREA 7

Channels of Behaviour

Online: ServiceNow incident records containing Short Description & Description text fields.

Offline: No separate offline customer channel specified; limited to manual IT staff review.

AREA 8

Problem Root Cause

- Incident classification is purely a manual task.
- Lack of automated keyword evaluation at creation time.
- Multiple daily requests make manual triage highly inefficient.

AREA 9 & 10

Your Proposed Solution

- **ServiceNow Flow Designer:** Automatically analyze keywords in Short Description and Description upon creation.
- Apply predefined rule conditions for auto-categorization.
- Maintainable, no-code approach allowing easy rule updates.

Fit Summary: The proposed solution directly addresses the core operational bottleneck: manual incident classification is time-consuming and inefficient. By leveraging ServiceNow Flow Designer to evaluate keywords at incident creation, the system achieves reduced manual triage effort, faster routing, and high maintainability through no-code configuration.
