

Auto Ticket Classification using Flow Designer

Proposed Solution Specification Template

TEAM ID

SWTID-2026-8437

DATE

01 October 2026

PLATFORM

ServiceNow Cloud

MAXIMUM MARKS

2 Marks

Proposed Solution Parameters

S.No	Parameter	Description & Implementation Details
1	Problem Statement	The school IT helpdesk receives multiple incident requests from students and teachers, including Wi-Fi issues, projector failures, password problems, and slow computers. IT staff currently review each request manually and assign a category. This repeated manual classification is time-consuming and inefficient, especially when many incidents arrive daily.
2	Idea / Solution Description	Implement a ServiceNow Flow Designer flow that runs automatically when an incident is created. The flow reads the incident's Short Description and Description, checks predefined keywords using conditional logic, determines the appropriate incident category, and updates the incident automatically. The categorized incident can then be handled or routed more efficiently by IT staff.
3	Novelty / Uniqueness	The solution applies a simple no-code automation approach to a repetitive helpdesk activity. Instead of requiring custom application code or a separate classification application, the classification rules are maintained directly in ServiceNow Flow Designer. The keyword rules can be easily extended as new incident types are identified.
4	Social Impact / Satisfaction	Students and teachers receive more organized and timely handling of their technical requests because incidents are classified immediately after creation. IT staff spend less time on repetitive categorization and more time addressing actual technical issues. Consistent classification directly supports efficient ticket routing.
5	Business / Revenue Model	This is an internal school IT service-improvement solution rather than a direct revenue-generating product. Its measurable value is operational: reduced manual effort, faster classification, improved routing efficiency, and better use of IT support resources within the school's existing ServiceNow environment.
6	Scalability of Solution	The solution can be expanded by adding more keywords, conditions, incident categories, and routing actions in Flow Designer. The same design supports additional school IT issue types and higher incident volumes without changing the basic workflow architecture. Future enhancements can include priority or assignment rules while retaining the core no-code design.

Operational Impact Summary: By automating ticket triage directly at incident creation, Team SWTID-2026-8437 eliminates
