

Auto Ticket Classification using Flow Designer

Solution Architecture & Data Flow Specifications

TEAM ID SWTID-2026-8437	DATE 01 October 2026	PLATFORM ServiceNow Cloud	MAXIMUM MARKS 4 Marks
----------------------------	-------------------------	------------------------------	--------------------------

Architecture Goals & Objectives

Practical Technology Bridge: Connects the school IT helpdesk manual classification problem directly to a native ServiceNow technology solution.	Behavioral Structure: Clearly defines the execution flow of Flow Designer automation for project stakeholders and administrators.
Processing Stages: Defines explicit stages: incident creation, text evaluation, keyword matching, auto-classification, and support routing.	Maintainable Blueprint: Delivers a clean specification for implementing and sustaining a low-code/no-code setup in ServiceNow.

Architecture & Data Flow Diagram

Architecture Components Specification

S.No	Component	Role in Solution Architecture
1	Incident Submission	Students or teachers submit an IT incident containing text in Short Description and Description.
2	ServiceNow Incident Record	Stores request data and serves as the primary data entity consumed by the automation layer.
3	Flow Designer Trigger	Listens to database events and automatically initiates the flow execution upon record creation.
4	Keyword Analysis	Flow Designer parses and evaluates configured string conditions across the text fields.
5	Classification Logic	Evaluates conditional rules to determine the accurate incident category based on keyword matches.
